Response to Arguments

Applicant's arguments filed 2/28/2006 have been fully considered but they are not persuasive.

Applicant asserts that the laminated assembly is an assembly of laminations, not a solid part (pg. 5-6).

Firstly, the Office points out that Faita does not disclose a solid part, but layers.

Faita discloses a bipolar plate with layers in which the bipolar plate assembles with the gasket, and the distribution channels (3) on the bipolar plate coincide with the channels (11) of the gasket, thus meeting applicant's limitation "header channels" on the third layer disposed between the first and second layer. Faita's through channels are present on in the first and second side comprising grooves (15:66-67). Thus, in light of the interpretation of Faita, the prior art has been found to read on the instant claims.

Applicant asserts that Examiner has totally disregarded the structural differences of the lamination over prior art comprising just single layer (pg. 7).

The Office has considered the "lamination" limitation. However, the applicant's bipolar plate is not found to be <u>structurally</u> different from Faita's invention. Thus, it was not given patentable weight. Applicant argues that the hidden portions of the header channels result in thickness of the first layer and is present in the final product. However, Faita's bipolar plate also possesses header channels between two layers and

Application/Control Number: 10/711,685 Page 3

Art Unit: 1745

hides the hidden portions of the header channels, as expounded above, and thus, has been found to read on the instant claims.

Applicant asserts that discrete layers are present (pg. 8).

In response, the Office notes that the applicant does not claim discrete layers in the instant set of claims. Although the claims are interpreted in light of the specification, limitations from the specification are not read into the claims. See *In re Van Geuns*, 988 F.2d 1181, 26 USPQ2d 1057 (Fed. Cir. 1993). As mentioned in the previous Office Action, since the applicants do not specify that each layer comprises a different material, the limitation of the layers was not seen as being distinct over prior art comprising one layer, since the instant layers are bonded/laminated.
